## Background

### Background

The enhanced specificity Cas9 protein from *Streptococcus pyogenes* (~160 KD), modified at sites K848A/K1003A/R1060A, exhibit substantially reduced off-target cleavage in cells. When combined with target RNAs, eSpCas9 protein will act as a targeted nuclease suitable for transfection of cell cultures and help the development of genetically-modified animals via one-cell embryo injection.

### Synonyms

CRISPR-associated endonuclease Cas9/Csn1, SpCas9, SpyCas9
