### Overview

#### Description

Beta-amyloid ( $A\beta$ ) is one of the intrinsically disordered proteins (IDPs) involved in Alzheimer's disease (AD) pathogenesis. This peptide derives from the sequential cleavage of a transmembrane glycoprotein, amyloid precursor protein (APP), by beta secretase and gamma secretase. The abnormal metabolism of APP result in excessive accumulation of  $A\beta$ , and triggers neurofibrillary tangles, oxidative stress, microglial activation, synaptic dysfunction, synaptic loss and the inflammatory response.

#### Product Note

Recommended dilution factor:

ELISA: 1:5000-20000

WB:1: 1000-5000

Note: Working dilution for specific application should be determined by the investigator to obtain the best conditions.
